OBJECTS

INSTRUCTIONS:

Goal of the Project:

In Class 1, you have learned the basic concepts related to object-oriented programming (OOP) and have created a paddle and a ball using those concepts. An object in code represents a physical object in the world. The physical object has properties, like shape, color, size, etc.

In this project, you will have to practice and apply what you have learned in the class and create a city layout, of which you are a Mayor.

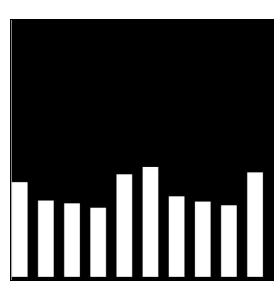

Story:

As a mayor of the city, you need to create sufficient housing to have no homeless people in your city. You have a fixed amount of space to build housing and buildings for every family in the city.

360 families live in the city. Each Floor can house 2 families in two adjacent apartments. Hence, a building of 12 floors will house 24 families. You have space to create only **10 buildings**.

Your task is to create an arrangement of buildings in the city. You can control how high a building can be by assigning the floors to a building.

*This is just for your reference. We expect you to apply your own creativity in the project.

OBJECTS

Getting Started:

- 1. Login to https://editor.p5js.org
- 2. Click on the following link: https://editor.p5js.org/rupin/sketches/UDOEMKpim
- 3. Click on "Duplicate" under the File menu.

- 4. This will create a copy of the sample project in your account.
- 5. Click on "Save" under the File menu to save your project, or Command+s on Mac and CTRL+s on windows systems.

6. Rename the project to Project 1 instead of Create your own city and click on Save.

OBJECTS

Specific Tasks to complete the Project:

Two buildings have been already created in the project for you.

- 1. We have a "Building" object, which has a "floors" property and a "position" property.
 - The floors property of the building object determines how high a building will be.
 - The **position property** determines where the building will be placed.
- 2. Create additional "Building" objects, enough to house all the residents of the city.
- 3. Define the number of floors of a building by assigning a number to the floors property.
 - <building object>.floors=23;
- 4. Position the building at the location 1, 2, 3, etc. by setting the position property of the building object.
 - <building object>.position=1;
- 5. Display the building in the **draw loop**, by calling the display function of the object
 - <building object>.display()
- 6. Do steps 3, 4 and 5 for all building objects created.
- 7. Make sure your city looks unique, by not creating all buildings of the same size, and adding a few open spaces for the residents to use.
- 8. Click on "Play" once to check if it is working.

Submitting the Project:

1. Click on "Save" under the File menu to save your project or Command+s on Mac and CTRL+s on windows systems.

^{*}Refer to the images given above for reference.

OBJECTS

2. Create a sharable link on the p5.js editor by clicking on **File** and then clicking on **"Share"**, as shown below.

3. Copy this link and submit it in the Student Dashboard Projects panel against the correct class number.

OBJECTS

Hints:

- 1. By skipping some numbers in the position property between two buildings, you can create empty spaces.
- 2. Try and organize buildings of different heights so that smaller buildings do not fall in the shadow of the bigger ones, and hence get less light and air.
- 3. Build buildings of differing heights, to give your city a unique character.

REMEMBER Try your best, that's more important than being correct.
After submitting your project your teacher will send you feedback on your work.
